PROFESSIONAL PROFILE

Full-Stack / Software Developer with an Artificial Intelligence & Machine Learning specialization. Second-year B.Tech Computer Science and Engineering student focused on building full-stack web applications, deployed platforms, and AI-integrated software, including computer-vision and OCR based systems. Comfortable working across the frontend and backend of a project, from interface design to deployment, while progressively developing deeper expertise in machine learning and deep learning through coursework and independent projects. Interested in software engineering roles that combine practical product development with applied AI/ML.

EDUCATION

Pranveer Singh Institute of Technology *Expected Graduation: 2029*

B.Tech — Computer Science & Engineering (Specialization: Artificial Intelligence & Machine Learning)

Semester 1 SGPA: 7.18 | Semester 2 SGPA: 7.05 | Approx. cumulative average: 7.12/10 (simple average of completed semesters; not an official university-issued CGPA)

Dr. Virendra Swarup Public School *2025*

Class XII — ISC | 88.25%

Dr. Virendra Swarup Public School *2023*

Class X — ICSE | 78%

TECHNICAL SKILLS

Languages & Core:	C, C++
Web / Frontend:	HTML, CSS, JavaScript, React, Tailwind CSS
Backend / Tools:	FastAPI, Git, GitHub, VS Code
AI / Computer Vision:	EasyOCR, OpenCV
Currently Learning:	Python, Java, PyTorch

EXPERIENCE

Web Developer — Client Project *Shams Talent Management Services*

shamstalentmanagementservices.com

- Independently developed the complete frontend of a live client website from the ground up, taking full ownership of the project from initial development through to deployment.
- Designed and built a responsive user interface that adapts cleanly across desktop and mobile screen sizes for real end users.
- Implemented custom animations and interactive frontend behavior to improve site engagement and visual polish.
- Built and integrated a functional contact form to enable direct client-to-business communication.
- Handled end-to-end deployment of the site, managing the transition from local development to a publicly accessible live website.

PROJECTS

JalDrishti — Water-Disaster Reporting & Monitoring Platform

[GitHub](#) | [Live Demo](#)

A citizen-focused platform for collecting, verifying, visualizing, and tracking water-related disaster incidents such as flooding, waterlogging, sewage problems, and coastal hazards, with map-based visualization and monitoring tools intended for government and citizen use.

- Contributed to integration work on the platform, supporting features such as location-aware incident reporting, severity/status tracking, and map-based visualization of reported disasters.
- Implemented and integrated the x402 protocol into the platform as an additional requirement for a separate competition track, extending the system beyond its core reporting functionality.
- Worked within a team environment using Git/GitHub for version control and collaborative development.

Coastal Social — Simulated Social Media Disaster-Detection App

[GitHub](#) | [Live Demo](#)

A simulated social-media application demonstrating how an ML-based disaster intelligence system could automatically detect water-disaster images posted on social media and forward identified incidents to JalDrishti as reported problems, following the flow: social media post → image analysis → ML-based disaster detection → incident forwarded to JalDrishti → report created.

- Worked across both the frontend and backend of the application, building the interface for viewing simulated posts alongside the server-side logic connecting the app to JalDrishti.
- Helped build the end-to-end pipeline connecting simulated social media content to the JalDrishti disaster-reporting system, enabling detected incidents to flow automatically into JalDrishti as reports.
- Collaborated with a teammate to integrate the two applications (Coastal Social and JalDrishti) into a single connected workflow.

Swasthya Setu — Healthcare Software (ML/OCR Module)

[GitHub](#)

A healthcare-related software project featuring an ML/OCR pipeline designed to read medicine names, identify medicine types, and extract information from medical reports. (Not deployed.)

- Trained the machine learning / OCR model used in the project's medicine-recognition and report-extraction pipeline, using EasyOCR and OpenCV for text detection and image processing.
- Built and tuned the OCR-based workflow responsible for reading medicine names and identifying medicine types from image input.
- Focused specifically on the ML/OCR component of the application as part of a larger team effort on the overall system.

ResNet from Scratch in PyTorch (*In Progress*)

A research-paper implementation and self-directed learning project based on the original ResNet paper, undertaken to build a deeper, from-first-principles understanding of deep learning architectures.

- Currently implementing a Residual Neural Network (ResNet) in PyTorch from scratch, working through convolutional layers, residual blocks, and skip connections as described in the original paper.
- Building and training the model on the CIFAR-10 dataset, with the ongoing goal of completing training, validation, and model evaluation.
- Undertaking this project to strengthen practical PyTorch skills and deepen understanding of core deep-learning architectural concepts, alongside coursework in Python and PyTorch.

ACHIEVEMENTS

Build with Bharat 2.0 — NIT Delhi

Semi-Finalist

OOSC 4.0 — IIT Allahabad

Shortlisted
